Rubert SM. Rosen CA, Harash SC, 2001 483426/52. N-PSEB# AAK62065 Nucleic acids encoding human immune/hematopoietic antiqen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis

```
ANK54951 to ANK64782 encode the human immune/harmatopoietic antique (1) amino acid sequences given in AAM82170 to AAM9521. (1) have evitostatic activity, and can be used in gene therapy and varcine production. (1) proteins and polymarlectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mulations or deletions in a patient's genome that affect the activity of (1) bediction of (1). Additionally, (1) supplement the patients own production of (1). Additionally, (1) polymoricotides may be used to produce the secretal (1), by inscribing the nucleic acids into a host cell and culturion the cell to express the protein. (1) proteins and polymorleotides may be used to prevent. Characters and cauch metal amentopoletic related diseases, especially calcers and cancel metal asset of harmatopoletic derived cells. ANK64703 to AAK87694 represent human immune/harmatopoletic antique general AAM82169 sequences from the present human immune/harmatopoletic antique general AAM82169.
                                                                                                                                                                                                                                                                                                                                                                             represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sdps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (1) and polypeptide (11) sequences. (1) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polyperides, useful in
diagnostics, forensics, gere mapping, identification of mutations
responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention is directed to HAP28 polypoptides, BAP28 polynucleotide sequences and regulatory region located at the 3' and 5' ends of the BAP28 coding region. The BAP28 polypeptides can be expressed by standard recombinant methodology. BAP28 polynucleotides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HAP28 expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suffering from or susceptible to prostate cancer. Antibodies specific for the AM28 polymegatides are useful as diagnostic reagents. Beliable markers of the BAP28 game are useful in genetic analysis. The present sequence replesents a protein encoded by a first CDNA sequence of the BAP28 game consisting of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 ATTLAPRVLLPATKKTYKQTEKNWKNHMCPPMSTLQEHIGXMKKFELTSHQSQLTAFFTE 120

the specification. The priner sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynocleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins cheeded by the full-length cDNAs. The primers allow obtaining of the full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cDNAs easily without any specialised methods. AAH04166 to AAH14628 and AAH14634 to AAH18742 represent human cDNA segmences. AAB92446 to AAH4689 AAH95893 represent human edid sequences; and AAH13624 to AAH13632 represent cligonucleotides.
                                                                                                                                                                                                                                                                                                       The present invention describes primer sets for synthesising 5602 full length cDNAs defined in the specification. Where a primer set comprises: (a) an oilgo-dl primer and an oilgonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the cingonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5° end
                                                                                                                                                                        Primer sets for synthesizing polynucleotides, particularly the 5662 tull-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the 5'-end sequence/3'-end sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        162 MKKEELJSHQSQTTAFFLEALDFFAQHSENDLEEVGKLEN, LLD: JVAMVVKLSEVTFRP 161
